β(	1	1. (twice amended) An electrical connection arrangement comprising a
	2	flexible multi-layer foil-like electrical conductor track element having at least one
	3	connection portion electrically connected to a connection zone of an electrical
	4	component, wherein walls of a housing of the electrical connection arrangement are
	5	provided in the vicinity of said connection portion and said connection zone, said
	6	walls being arranged such that they form, along with the electrical component, a
	7	basin, said basin being open on one side only, and an originally flowable molding
	8	mass is distributed in said basin such that said connection portion of the electrical
	9	conductor track element and said connection zone of the electrical component are
	10	completely covered by the molding mass.
	1	10. (Amended) The electrical connection arrangement of Claim 1 wherein at
	2	least one layer of said track element comprises electrically conductive tracks.
_		

least one layer is an electrically isolating layer.
